The present sequence encodes a thermostable avicelase polypeptide, designated AviIII. AviIII is a member of the glycoside hydrolase family of enzymes, and is a cellulase. AviIII is useful in the conversion of biomass to biofuels and biofuel additives. It may be useful in the production of detergents, pulp and parer processing, food and feed processing and in textile processes. The thermostable AviIII peptide is useful in the degradation of cellulose, and in generating specific anti-AviIII antibodies that are useful in purifying recombinant AviIII polypeptides from genetically engineered host cells, in detecting AviIII polypeptide expression, as well as a reagent tool for characterizing the molecular actions of the polypeptide. The AviIII polymucleotide is useful as a source of probes or primers in various diagnostic assays
                                                                                                                                                               useful

                                                                                                                                                      The invention relates to an isolated polynucleotide molecule encoding thermostable AviIII polypeptide. The polynucleotide is useful for detection of a polynucleotide encoding AviIII. The polynucalotide is useful for reducing cellulose in a starting material which involves administering to the starting material, e.g. agricultural biomass or municipal solid waste, a polypeptide molecule of the polynucleotide. Method further comprises administering a second polypeptide molecule chosen from the glycoside hydrolase family of proteins. The present sequence represents DNA encoding the Acidothermus cellulolyticus avicelase AviIII.

The present sequence encodes a xyloglucanase enzyme, belonging to family 74 of glycosyl hydrolases. The enzyme is isolated from Jonesia sp. DSM14140. The enzyme is useful in processes for machine treatment of fabrics. It is also useful in the textile industry for improving the properties of cellulosic fibers, yarn, woven or non-woven fabric, and in a textile scouring process step. The xyloglucanase enzyme is also useful in the cellulose fiber processing industry for ratting of fibers such as hemp, jute, flax and linen. It is useful for preventing binding of certain soils to the xyloglucan left on the cellulosic material
                                                                      New xyloglucanase enzyme belonging to family 74 of glycosyl hydrolases, and endogenous to a bacterium, useful in the textile industry for improving properties of cellulosic fibers, yarn or fabric.
                                                                                                                                                                         Claim 11; Page 68-72; 76pp; English

The invention relates to a Family 74 xyloglucanase (ADD42055) from the fungus Trichoderma reesei (Hypocrea jecorina), and nucleic acids encoding it (e.g., ADD42064). The enzyme hydrolyses the beta-1,4-glycosidic linkages in the backbone of xyloglucan to xyloglucan oligosaccharides. The invention also relates polypeptide sequences at least 70% identical comparison of the enzyme, expression vectors and host cells comprising a nucleic acid of the invention, the recombinant production of the enzyme, and mutant enzymes and the nucleic acids encoding them. The xyloglucanase of the invention can be used in the degradation of cellulose- and hemicallulose-containing biomass to produce ethanol. It can also be used in a detergent composition for treating fabric during a machine washing cycle. The present sequence represents the gene encoding Trichoderma reese is family 74 xyloglucanase. Note: A comparison of this sequence with that the present sequence listing (also referred to as SEQ ID NO:1) shows that the present sequence listing (also referred to as SEQ ID NO:1) contains alternate 60 bp blocks of sense strand and complementary strand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptides having Family 74 xyloglucanase activity, and encoding nucleic acid molecules, useful for degrading cellulose- and hemicellulose containing biomass to ethanol or as a detergent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          BP; 594 A; 882 C; 822 G; 551 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to polypeptide and polynucleotide sequences from Xanthomonas campestris which may be used for activity reduction or enhancement using directed genetic engineering. A transformed cell or organism having reduced or enhanced activity of at least one such protein e.g. galactomannanase can be generated by disrupting the gene encoding the protein. The activity of the protein is reduced by the presence of an antisense nucleic acid sequence. The nucleic acid sequence of the gene encoding the protein is a recombinant sequence having at least one mutation as compared to the wild-type gene encoding the protein. The transgenic cell or microorganism are useful for producing xanthan gum, which are useful for providing formulations and properties, such as longtern suspension and emulsion stability in alkaline, acid, and salt solutions, temperature resistance, and pseudoplasticity. The present

The invention relates to a Family 74 xyloglucanase (ADD42055) from the fungus Trichoderma reesei (Hypocrea jecorina), and nucleic acids encoding it (e.g., ADD42054). The enzyme hydrolyses the beta-1,4-glycosidic linkages in the backbone of xyloglucan to xyloglucan oligosaccharides.

The invention also relates polypeptide sequences at least 70% identical to the enzyme, expression vectors and host calls comprising a nucleic acid of the invention, the recombinant production of the enzyme, and mutant enzymes and the nucleic acids encoding them. The xyloglucanase of the invention can be used in the degradation of cellulose- and hemicallulose- containing biomass to produce ethanol. It can also be used in a detergent composition for treating fabric during a machine washing cycle. The present sequence represents a Trichoderma reesei Family 74 xyloglucanase-encoding DNA. Note: The present sequence (referred to as SEQ ID NO:1) is given as shown in figure 1 (also referred to as SEQ ID this sequence with that shown in figure 1 (also referred to as SEQ ID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptides having Family 74 xyloglucanase activity, and encoding nucleic acid molecules, useful for degrading cellulose- and hemicellulose containing biomass to ethanol or as a detergent.
                                                                                                                                                                                                                                           Trichoderma reesei; Family 74 xyloglucanase; beta-1,4-glycosidic linkage; xyloglucan hydrolysis; biomass degradation; cellulose; hemicellulose; ethanol production; detergent composition; fabric treatment; textile treatment; ds.

The present in the present in describes a metrous fungal (FF) cell relative to expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTs are used in the methods for monitoring differential expression of genes common for a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production potential common common feel of the microorganisms to be improved. New genes may be discovered, to of the microorganisms to be improved. New genes may be discovered, confittions, environmental stress, spore morphogenesis, recombination, conditions, environmental stress, spore morphogenesis, recombination, conditions, environmental stress, spore morphogenesis, recombination, advantages over genomic or random cDNA clones including elimination of advantages over genomic or random cDNA clones including elimination of conduction of the microarrays begues on function of the gene correspondent to facilitate analysis of the results. AAF07478 to AAF11247 represents

Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for

                                                                                                                                                                                                                                                                                                                                                                                                                 capable of altering the sensitivity of a microorganism to an antimicrobial agent by employing efflux pumps comprising polypeptides encoded by the following genes: PA1874, PA4142, PA2389, PA1876, PA4143, PA2390 or PA163. The method is useful for identifying modulators of microbial resistance of an organism in a biofilm. The methods are also useful for identifying genes that encode proteins that play a role in biofilm resistance. The method is particularly useful for screening compounds or discovering compositions that will inhibit biofilm formation and overcome their resistance mechanisms. These methods are particularly useful in medical, industrial or natural settings, where formation of biofilms can have serious negative consequences and result in high costs both in human health and economic terms. The present sequence is a
                                                                                                                                                                                                                                                               Identifying modulators of microbial resistance of organisms in biofilms, e.g. inhibitor of biofilm formation, by employing expression controls, or efflux pumps containing polypeptides, of genes associated with biofilm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   coding/control sequence shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                 present invention relates to a method of identifying a compound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 7407 BP; 1387 A; 2763 C; 2378 G; 879 T; 0 U; 0 Other;

the foll antiennes sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated containing the vector; (3) an isolated are:

(2) proliferation or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular continuation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for the proliferation, (7) identifying a compound that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; sactivity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of product is overexpressed or underexpressed; (12) determining the extent compound; sactivity; (11) a culture comprising strains in which each of the strains is present in a culture or collection of the strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids are useful for identifying proteins or screening for homologous nucleic acids are useful for identifying the careary and the careary and the careary and the careary and the careary and the careary and the careary and the careary and the careary and the careary and the careary and the careary and the careary and the careary and the careary and the careary and the careary
                                     GlnTyrGlyAsnTrpGlyGlnAlaileThrGlyAspHisAlaAsnLeuArgArgValTyr 721
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               or screening

```
The invention relates to an isolated nucleic acid compileration of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antisense
encoding a polypeptide whose expression is inhibited by the antisense
nucleic acid; (2) a host cell containing the vector; (3) an isolated
colypeptide or its fragment whose expression is inhibited by the
antisense nucleic acid; (4) a natibody capable of specifically binding
the polypeptide or its fragment whose expression is inhibited by the
antisense nucleic acid; (4) a natibody capable of specifically binding
the polypeptide or its fragment whose expression is inhibited by the
cartisty of a gene in an operon required for
proliferation or the activity of a gene in an operon required for
proliferation, or that has an activity against a biological pathway
compound or the activity of a gene or the biological pathway
in which a proliferation-required gene or its gene product lies
or a gene on which the test compound that inhibits proliferation of an
organism acts; (9) manufacturing an antibiotic; (10) profiling a
compound's activity; (11) a culture comprising strains in which the gene
product is overexpressed or underexpressed; (12) determining the extent
compound's activity; (11) a culture comprising strains in which the gene
product is overexpressed or underexpressed; (2) determining the extent
compound's activity; (11) a culture comprising strains in which the gene
product is overexpressed or underexpressed; (2) determining the extent
compound's activity; (12) a culture comprising strains in which the gene
compound's activity; (13) a culture comprising strains in the compound that inhibits the
compound's activity; (12) a culture compressed; (2) determining or an organism. The antisense nucleic acids are useful for proliferation of an organism. The antisense nucleic acids are useful
control discovery programs, or for screening homologous nucleic acids
crequired for proliferation i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     98 AlaileLeu-----ArgSerSerAspGlnGlyAlaThrTrpGlnIleThrProLeu 114
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               78 ThrAsnLysValTrpAlaAlaValGlyMetTyrThrAsnSerTrpAspProAsnAspGly

```
the 6113 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid;

(2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway cequived for that the set compound that inhibits proliferation; (8) identifying a gene required for required gene or its gene product lies or agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture complising strains in which the gene product is oversxpressed; (12) determining the extent the compound's activity; (11) a culture compound; (12) determining the extent the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the compound of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                   screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          strains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    invention relates to an isolated nucleic acid comprising any one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated opypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation; (7) identifyly of a gene in an operon required for proliferation; (7) identifyly a activity against a biological pathway required for proliferation, or that has an activity against a biological pathway and agene required for cellular proliferation; (8) identifying a gene required for cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an

organism acts; (9) manufacturing an antibiotic; (10) profilling a compound's activity; (11) a culture comprising strains in which the gene product is overspressed or underexpressed; (12) determining the extent ct owhich each of the strains is present in a culture or collection of the strains is present in a culture or collection of corrections of an organism. The antisense nucleic acids are useful for intentifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational carp programs, or for screening homologous nucleic acids required corrections or acreening for homologous nucleic acids required crequired for proliferation in cells other than S. aureus, S. typhimurium, C. prokunctic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in celectronic format directly from WiPo at.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              111 IleThrProLeuProPheLysLeuGlyGlyAsnMetProGlyArgGlyMetGlyGluArg 130
